Embed the Contact Form in your Website!

An **iFrame** is the easiest way to integrate the contact form into your website so that it is **responsive**. You only need to insert a small line of code at a suitable position! It does not matter whether it is a static or a dynamic website (e.g. **WordPress**, **Bootstrap**, **Joomla!**, **Typo3**, etc.)

The <u>**Define height**</u> **section in particular is worth reading for a fully responsive integration!**

1. Insert the following code at a suitable position!

```
<iframe src="contact.php" style="border: none; width:100%; height:700px;"></iframe>
```

Note: This iFrame does not yet include automatic height adjustment.

» Go to iFrame with automatic height adjustment!

2. Customize the iFrame!

URL for the form

Insert the URL for the contact form between the quotation marks of **src=""**. Pay attention to whether the URL starts with http: or https:!

Set the width

You can adjust the width of the iFrame using the **width** parameter.

Note: If you do **not** want the contact form to be responsive, you can also enter the value under "width" in px. For example:

```
<iframe src="contact.php" style="border: none; width:720px; height:700px;"></iframe>
```

Set the height

You can adjust the height of the iFrame using the **height** parameter. As an alternative, you can have the height adjusted automatically. **See next page!**

Tip: iFrame with automatic height adjustment

1. You can also set the height to automatic adjustment. To do so, insert this JavaScript code between <head> and </head> on the page on which you want to embed the contact form:

```
<script type="text/javascript">
  function iframeLoaded() {
      var iFrameID = document.getElementById('idIframe');
      if(iFrameID) {

          iFrameID.height = "";
          iFrameID.height = iFrameID.contentWindow.document.body.scrollHeight + "px";
      }
  }
</script>
```

Important: The JavaScript code only works if the contact form is on the same domain. Note for WordPress users: You can use this plugin to insert JavaScript: **Insert Headers and Footers**.

2. In addition, insert this iFrame code at a suitable position:

```
<iframe src="contact.php" id="idIframe" onload="iframeLoaded()" style="border: none; width:100%;" allowfullscreen
scrolling="no"> </iframe>
```

Ensure you use the correct URL between the quotation marks of src="" if you write out the URL. (especially with regard to http: or https:)

3. Only relevant if the success message (see config.php, line 13) has been disabled: Please remember to use a frame breaker script for the thank-you page. **See next section!**

3. Show the thank-you page outside the iFrame!(Frame breaker script)

It can make sense to display the thank-you page outside the iFrame. Insert this code in your thank-you page between <head> and </head>.

```
<script type="text/javascript">
if (top != self)
  top.location = self.location;
</script>
```

Note for WordPress users: You can use this plugin to insert JavaScript: **Insert Headers and Footers**.

4. You're done! :-)
